

PRIVATE CLIENT ACCESS

SEXTANT

BY VERITASVAULT

Know where you stand.

The allocation method institutions use for billion-dollar mandates, applied to your own digital-asset portfolio — with every decision written down.

FOR

Private investors

STATUS

Early access

Most digital-asset portfolios are allocated by feel

Not through carelessness — through the absence of any practical alternative at individual scale.

I

Position sizes chosen by instinct

You hold a conviction about an asset. Translating that conviction into a defensible position size — relative to everything else you own — is guesswork. So the number is usually round, and usually arbitrary.

II

Yield chased, risk inferred

Pools get compared on headline yield because that figure is visible. Protocol risk, concentration and correlation are what actually determine the outcome — and they are the figures nobody shows you.

III

No record of why

Six months on you cannot reconstruct why you took a position, what you believed at the time, or whether the thesis held. Without that record, there is nothing to learn from.

THE GAP

Institutions solved this decades ago. They do not allocate by instinct — they start from what the market already implies, add their own views with explicit confidence, and record both. The method exists. It has simply never been available at your scale.

What changes with an instrument

- Position sizes follow from your views, not from round numbers
- Conviction becomes a number you set, not a feeling you defend
- Risk is a constraint applied up front, not a lesson learned after
- Every decision leaves a record you can review honestly

Take a reading. Then set your course.

A sextant does not tell you where to sail. It tells you precisely where you are, by measuring against references that do not move. Everything after that is your decision. This is the method we are building to — see the status page for exactly where it stands.

STEP ONE

Fix your position

Rather than forecasting from a blank page, we begin from the returns the whole market's positioning already implies — a neutral, defensible reference point that requires no prediction from you.

STEP TWO

Declare your bearing

State your views directly — “this asset will outperform that one”, or “this one returns 8%”. For each, you set how confident you are, and you write down why.

STEP THREE

Sail the blended course

The Black-Litterman model combines both mathematically. Your portfolio tilts toward your views in proportion to your confidence — decisively if you are certain, barely if you are not.

Why this beats picking numbers

Conventional portfolio optimisation is notoriously unstable — a small change in a return estimate can swing the whole allocation into absurd concentration. Black-Litterman anchors to market equilibrium, so weights stay sensible, and an extreme position can only appear if you have explicitly stated a view that justifies it.

The instrument never overrules you

Confidence is your input, not the model's. A view you hold loosely moves the portfolio slightly; one you hold firmly moves it decisively. Sextant does not decide how much you believe something — it works out what that belief implies for your weights.

Your conviction, written down and measured

Each view is a record. The portfolio that results is fully attributable back to those records.

What you record when you form a view	
The view	Absolute ("this returns 8%") or relative ("this beats that")
Confidence	How strongly you hold it — this sets its influence
Rationale	Why you believe it, in your own words
Evidence	What you are basing it on
Expiry	When it should lapse if untested

What Sextant tells you back	
Impact	How much this view actually moved your portfolio
Weight change	Exactly which holdings shifted, and by how much
Return effect	Expected return attributable to this view
Risk effect	Risk this view added — or removed
Total tilt	How far you now sit from a neutral market position

WHY THIS MATTERS MORE THAN IT SOUNDS

Most investors cannot separate a good decision from a lucky one. When every position traces back to a dated, written, confidence-weighted view, you can finally review your own judgement honestly — which views paid, which did not, and whether your confidence was calibrated. That is the advantage that compounds.

The platform, day to day

Portfolio

Holdings, allocation and drift from your target weights

Liquidity pools

Discovery and detail across protocols, compared on more than yield

Strategies

Build, compare and deploy allocation strategies

Risk assessment

Protocol and concentration risk scored before you commit

Performance

Attribution — what actually drove the result

Analytics

Historical reporting with dimensions you choose

Watchlist

Track assets and pools before allocating to them

Settings

Constraints and limits, applied automatically

Try it before you commit anything

A guided demo mode takes you through the full platform — build a portfolio, state views, watch the allocation change — without connecting a wallet or moving a single asset. If the method does not convince you, you will have lost an afternoon and nothing else.

The same method as the institutional platform

Sextant is built on VeritasVault's allocation design, risk model and audit architecture — the same specification we take to funds and treasury operations, not a simplified consumer imitation of it. The interface is adapted for individual use; the method underneath is identical.

What is ready, and what is not

You are considering trusting this with real capital. You should know exactly what you would be joining.

CAPABILITY	STATUS	DETAIL
Platform & dashboards	READY	Portfolio, pools, strategies, risk, analytics and performance views are built and usable today.
Black-Litterman allocation	IN BUILD	The method is specified in full and the data contracts are settled, but the solver is not yet written — today the interface shows worked examples, not your live allocation. This is what the early group is funding, and the first thing you would see land.
Demo mode	READY	Live now at veritasvault.net/standard-demo — walk the interface without connecting a wallet or committing assets.
Live market data throughout	IN PROGRESS	Some views still run on reference data while we complete the connection to our live market-data service. We will tell you which, on the day you join.
Automated rebalancing	COMING	Execution will remain your decision by design — Sextant recommends, it does not trade on your behalf.
Independent security audit	COMING	The architecture is designed for external review and scheduled for it. It has not yet been completed.

WHAT EARLY ACCESS ACTUALLY MEANS

You would be joining a small first group, working directly with the founder, with real influence over what gets built next — and accepting a product that is early in exchange for that. If you want a finished, audited, battle-tested platform, this is not yet that, and we would rather you waited.

06 · NEXT STEPS

Stop sizing positions by instinct. Start recording what you actually believe.

1 · Take a reading

The platform is live — open **veritasvault.net/standard-demo** and look around now. No wallet, no commitment, no conversation required.

2 · Chart your own book

We take your actual holdings and show you what the allocation method says about them — and exactly why.

3 · Decide

Join the early group, or tell us what would need to be true first. Both are useful answers.
