

INSTITUTIONAL-GRADE LIQUIDITY MANAGEMENT

VeritasVault

Treasury, portfolio optimisation and risk management for institutional digital-asset operations
— built on Black-Litterman allocation, with an audit trail that holds up under scrutiny.

Your mandate does not fit on-chain infrastructure

Digital-asset yields are real. The operational apparatus a regulated institution needs to capture them is not.

I

Allocation by intuition

Most on-chain treasury allocation is discretionary or naively yield-chasing. There is no equilibrium anchor, no formal expression of house view, and no way to show a committee why the portfolio is weighted as it is.

II

Risk measured after the fact

Protocol risk, counterparty exposure and drawdown are reconstructed from block explorers and spreadsheets once something has already gone wrong, rather than enforced as limits at the point of allocation.

III

Evidence assembled retrospectively

When an auditor, regulator or investment committee asks why a position was taken, the answer is reconstructed from chat logs and memory — not produced from a system designed to record it.

WHAT THIS COSTS YOU

Capital sits on the sidelines, not because the opportunity is unattractive, but because the operating model cannot be defended to the people who must approve it. The constraint is governance, not conviction.

What a mandate actually requires

- **A defensible allocation method** with an economic rationale
- **Constraints enforced**, not merely monitored
- **Attribution** — which decision produced which exposure
- **An audit trail** produced as a by-product of operating, not assembled later

Three systems, one governed workflow

Treasury, portfolio and risk operate over shared data, shared constraints and a shared audit record — so a decision in one is visible and enforceable in the others.

Treasury Management

- Black-Litterman allocation **ROADMAP**
- Comprehensive audit trails and compliance reporting **LIVE**
- Multi-signature governance and approval workflows **ROADMAP**
- Automated rebalancing with institutional controls **ROADMAP**
- Formal verification of contract interactions **ROADMAP**

Portfolio Optimisation

- Multi-factor optimisation models **ROADMAP**
- Cross-chain yield comparison and allocation
- Custom constraints and institutional mandates
- Scenario analysis and stress testing **ROADMAP**
- Threshold-triggered rebalancing **ROADMAP**

Risk Management

- Protocol risk scoring and monitoring **LIVE**
- Counterparty risk assessment
- Real-time risk alerts and notifications
- Value-at-Risk calculation **ROADMAP**
- Regulatory compliance frameworks **ROADMAP**

Delivered as one interface

Nineteen institutional dashboard views — treasury, portfolio and model portfolio, on-chain and off-chain analytics, governance voting, risk assessment, performance attribution, watchlists and an administrative console.

CAPABILITY STATUS

Items marked *Roadmap* — including the Black-Litterman engine itself — are specified in full and scheduled, but not yet available for production use. We would rather tell you that on this slide than during your diligence.

Black-Litterman, applied to digital assets

The allocation framework institutional asset management already trusts — brought to on-chain portfolios without abandoning its theoretical foundation. Specified in full; in build now.

1 · Market equilibrium

Start from the returns implied by market-capitalisation weights — what the market as a whole already believes, rather than a forecast built from nothing.

2 · Your views

Express house views as absolute or relative statements, each with a confidence level, a written rationale and supporting evidence.

3 · Posterior allocation

Bayesian blending produces posterior returns and optimal weights — tilted toward your views in proportion to your confidence, and no further.

WHY IT MATTERS FOR A MANDATE

- **No unexplained concentration.** Weights derive from equilibrium plus stated views, so extreme allocations cannot appear without a view to justify them.
- **Confidence is explicit.** A weakly held view moves the portfolio weakly. Conviction is a parameter, not an argument.
- **Constraints are first-class.** Mandate limits, exposure bounds and asset restrictions enter the optimisation directly.
- **Results are interpretable.** Every output is economically meaningful — a requirement for committee approval and regulatory explanation.

Enhanced where estimation is weakest

The model's most fragile input is the covariance matrix. Our specification applies machine-learning shrinkage estimation — evaluated against Frobenius, KL-divergence and spectral loss, with ensemble architecture and explicit uncertainty quantification — to reduce estimation noise without disturbing the Bayesian framework.

AI that degrades gracefully

AI assists parameter estimation, view suggestion and confidence calibration. Every component is explainable, gated by validation, and optional: the platform remains fully functional with AI enhancement switched off.

Every tilt traceable to a named view

Auditability is not a reporting layer bolted on afterwards. It is the shape of the data model itself.

What a view records	
Rationale	Written justification, stored with the view
Supporting evidence	References backing the position taken
Author & timestamp	Who formed the view, and when
Confidence	Explicit weight given to the view
Expiry	Views lapse rather than persisting silently

What the result reports back	
Impact score	How much each view moved the portfolio
Weight changes	Per-asset delta attributable to that view
Return contribution	Expected return traced to the view
Risk contribution	Risk added or removed by the view
Tilt magnitude	Total divergence from market equilibrium

THE QUESTION THIS ANSWERS

“Why does the portfolio hold this position?” is answerable in one step — naming the view, its author, its rationale, its confidence, and the precise weight change it produced. That is the difference between a portfolio you can operate and one you can defend.

Designed for the people who must approve it

Immutability & audit

Every entity is versioned and every state transition emits an append-only record. Nothing is silently overwritten or retroactively edited.

Zero trust

Every interface is authenticated, authorised and monitored by default — including boundaries internal to the platform.

Defense in depth

Layered controls, circuit breakers and multi-signature paths, so that a single compromise is contained rather than systemic.

Regulatory-first

Compliance surfaces are pluggable by jurisdiction rather than hard-coded to one regulatory regime.

Architecture you can review

Seven independently auditable domains — core infrastructure, risk and compliance, asset and settlement, integration and analytics, governance and custody, AI/ML governance, and the integration gateway. Each can be security-reviewed and certified on its own timeline rather than as one monolithic approval.

Governed AI

Model registry and versioning, shadow and canary deployment, continuous fairness and drift monitoring, and complete traceability of AI inputs and decisions — designed to meet regulatory expectations for machine learning in financial decision-making.

No model vendor lock-in

AI workloads route through our own gateway with model abstraction and cost control, over an agent platform with role-based access control and audit logging. Which model provider sits behind it is a configuration decision — yours to constrain, and ours to evidence.

Three tiers, scaled to mandate complexity

Growth

For emerging funds and treasury operations

- Core treasury and portfolio dashboards
- Black-Litterman allocation
- Protocol risk scoring
- Standard audit reporting

Professional

For established funds and financial institutions

- Everything in Growth
- Custom constraints and mandates
- Cross-chain yield allocation
- Counterparty risk assessment
- Governance and approval workflows

Enterprise

For large institutions with complex needs

- Everything in Professional
- Jurisdiction-specific compliance packages
- Dedicated integration and adapters
- Bespoke reporting and data residency
- Direct engineering engagement

COMMERCIAL TERMS

Pricing, contract length, service levels and support commitments are set per engagement rather than published — mandates at this end of the market rarely fit a list price. We will put concrete numbers against your requirements once we understand them.

Allocation you can defend. Evidence you do not have to assemble.

See it now

The platform is live at **veritasvault.net** — solutions, pricing and whitepapers are open, and we will walk you through the dashboards against your own asset universe.

Model review

A technical session on the Black-Litterman implementation, covariance estimation and constraint handling.

Architecture review

Security, compliance and audit architecture, with your risk and technology teams present.
